

User Guide

Everything you need to use the Document Server — step by step.

What is this system?

The Related Document Server keeps all your scanned student documents in one place. When you add a document, the system reads it automatically and pulls out the details that matter for that kind of document (things like student name, course, ID number and date). You can then **search** for any document in seconds, and quickly **check** anything the system wasn't sure about.

The kinds of document it handles are **fully configurable**. Right now it's set up for **Certificates** and **POEs (Grade Books)** — but an administrator can add a brand-new document type at any time, with its own fields. See [Add your own document types](#).

You don't need any technical knowledge. This guide walks you through each task with pictures. Use the quick links below to jump to what you need.

Finding your way around

Along the top of every page is the menu. These are the only places you'll ever need:

1

Dashboard

The home page. See recent documents, how many need review, and add new documents.

2

Search

Find any document by student, course, ID number, or date.

3 Review Queue

The list of documents the system wasn't fully sure about, waiting for you to check.

4 Settings

For administrators — create and manage document types and set up the automatic reader. See [Add your own document types](#).

The screenshot shows the 'Related Document Server' Dashboard. The top navigation bar includes 'Dashboard' (active), 'Search', 'Review Queue', 'Settings', and 'User Guide'. The main heading is 'Document Dashboard' with the subtitle 'Manage and search your educational documents'. Below this are four cards: '2 Total Documents', 'Active Scan Folder', '1 Needs Review', and 'Search Find Documents'. The 'Recent Documents' section features a table with columns: STUDENT, COURSE, ASSIGNMENT, TYPE, GRADE, DATE, STATUS, and ACTIONS. It lists two documents: one by Aubrey Thabo Monametjiti (National Certificate: Generic, Certificate, 2025-08-21, COMPLETE) and one by Rudzani Aubrey Tshitshongwe (POE, 2025-01-01, NEEDS REVIEW). Below the table are sections for 'Upload Document' (with a dropdown for 'POE (Grade Books)' and a drag-and-drop area) and 'Bulk Upload' (with a drag-and-drop area). The footer reads 'Related Document Server © 2026'.

STUDENT	COURSE	ASSIGNMENT	TYPE	GRADE	DATE	STATUS	ACTIONS
Aubrey Thabo Monametjiti	National Certificate: Generic	—	Certificate	—	2025-08-21	COMPLETE	View Delete
Rudzani Aubrey Tshitshongwe	—	—	POE	—	2025-01-01	NEEDS REVIEW	View Delete

The Dashboard — your home base. The menu is along the top.

Upload one document

The quickest way to add a single document:

- 1 Go to the Dashboard**
Click *Dashboard* in the top menu.
- 2 Scroll down to “Upload Document”**
- 3 Choose the document type**
Pick the type from the drop-down. It lists whatever types your organisation has set up (right now, Certificates and POEs — but there may be more).
- 4 Add your file**
Drag the file onto the box, or click the box to browse your computer. PDF, PNG, JPG and TIFF files all work.
- 5 Wait a moment**
The system reads the document and opens its details automatically. That's it — it's saved.

Choose the type, then drag your file into the box (or click to browse).

After uploading, you'll land on the document's details page. If everything looks right, you're done. If a box is empty or wrong, just type the correct value and click **Save Changes**.

Upload many at once (Bulk Upload)

Have a whole stack to add? Bulk Upload handles them all — one at a time so nothing gets missed.

1 Go to the Dashboard

Scroll down to the *Bulk Upload* section (below the single upload).

2 Select all your files

Drag several files onto the box, or click it and hold *Ctrl* (or *Shift*) to pick many. Different document types can be mixed together — the system works out the type of each one for you.

3 Watch the progress

Each file moves through the steps: *Uploading* → *Identify* → *OCR Reading* → *AI Reading* → *Done*. They process one after another.

4 Check the results

Each file ends with a green **Approved** or an orange **Needs Review** label. Click a label to open that document.

Bulk Upload

Select multiple files (mixed types are fine). Each is processed one at a time and the type is auto-identified.

Drag & drop multiple documents here or click to browse

Supports PDF, PNG, JPG, TIFF

Drop a whole batch here. Each file is processed and labelled automatically.

Leave the page open until every file shows a result. Anything marked **Needs Review** will also appear in the *Review Queue* for you to fix later.

Check & fix documents (Review Queue)

Sometimes the system can't read a field clearly — for example, handwriting or a missing ID number. Those documents wait in the **Review Queue** so you can quickly put them right. Nothing is lost; they're just held for a human to confirm.

- 1 Open the Review Queue**
Click *Review Queue* in the top menu. Each row shows what's missing in the *Reason* column.
- 2 Open a document**
Click the *Review* button on the right of the row.
- 3 Compare with the scan**
The original scan is shown on the left. Read the details from it and fill in or correct the boxes on the right. Fields marked with a * are required.
- 4 Save**
Click **Save Changes**. Once all required fields are filled, the document leaves the queue automatically and is filed away.

Manual Review Queue

Documents that still need verification

Documents enter this queue when the OCR/AI step misses required fields or reports low confidence. Open each record, fill in the missing data, and save changes to remove it from the queue automatically.

The details page — scan on the left, editable fields on the right. Correct anything, then Save Changes.

The **Delete Document** button removes a document permanently and can't be undone. Only use it if a file was uploaded by mistake.

Find a document

The Search page finds any document already in the system.

1 Click *Search* in the top menu**2 Type what you're looking for**

Use the big search box for anything — a name, a course, or an ID number. Or use the boxes below to search a specific field or a date range.

3 Open a result

Click *View* on any row to open that document.

Search by anything, or narrow it down with the field boxes.

What the labels mean

You'll see these small coloured labels next to documents. Here's what each one means:

COMPLETE

Complete / Approved — all required details were found. Nothing for you to do.

NEEDS
REVIEW

Needs Review — a detail is missing or unclear. Open it, check it, and Save.

AI
ERROR

AI error — the automatic reader had a problem (for example, it couldn't connect). The document is safe — just fill the details in by hand. If this keeps happening, tell your administrator.

On a document's details page you may also see *"Extraction: Rules only"* or *"Rules + AI"*. This simply tells you whether the system needed its smart AI reader for that document. It doesn't change anything you need to do.

Add your own document types

The system is **not limited to Certificates and POEs** — those are just the two types set up today. Whenever you start handling a new kind of paperwork (a report card, an ID copy, an attendance register — anything), an administrator can create a new **document type** for it, with its own set of fields. This is done on the **Settings** page.

On Settings, every existing type is shown as a card listing its fields, with *Edit* and *Delete* buttons and an **+ Add Type** button at the top.

Create a new type — step by step

1

Open Settings and click "+ Add Type"

Under *Document Types*, click the **+ Add Type** button. An editor opens.

2 Give the type a name

Type a *Type name*, e.g. "Report Card". The *Key* next to it fills in on its own — it's a short internal id you don't need to worry about (it can't be changed later).

3 Set how many pages to read

Max pages is how many pages the system reads from each document. Use **1** for a single-page document like a certificate, or a few more for a booklet. Keeping it small keeps things fast.

4 Add the fields it should capture

Add existing field — pick a standard field (Student Name, Course, Student ID, Date...) from the drop-down and click *Add*.

Add custom field — for something new, type a field name (e.g. "Term"), choose what kind of value it holds (*text*, *number*, *date*, or *ID*), and click *Add*.

5 Mark each field required or optional

For every field, tick **required** if a document can't be filed without it, and **visible** to show it on the form. (Required fields are what decides whether a document needs review.)

6 Save

Click **Save**. The new type is ready straight away — it appears in the upload drop-down, and its fields show on the review form.

AI Extraction

Used as the fallback when rules-based extraction can't fill every field. Point Base URL at a self-hosted / OpenAI-compatible endpoint to keep data on-premises.

☒ Enable AI extraction

Provider: OpenAI

Model: gpt-5.4-mini

Base URL (optional): https://api.openai.com/v1 or http://localhost:11434/v1

API Key: leave blank to keep current

A key is currently set. Leave blank to keep it.

[Save AI Settings](#) [Test Connection](#)

Related Document Server © 2026

The Settings page — a card for each type, plus **+ Add Type** at the top.

You can **Edit** a type later to add or remove fields, or **Delete** a type you no longer use. If any documents still use a type, the system warns you before deleting it.

Document types are shared by everyone. If you're not sure whether to change one, ask your administrator first.

The automatic reader (for administrators)

The system reads most documents on its own. For harder ones — like handwriting — it can call on a smarter **AI reader**. This is optional and is set up once by an administrator, in the *AI Extraction* section of the **Settings** page (shown above).

1 Turn it on

Tick *Enable AI extraction*.

2 Enter the connection details

Choose the *Provider*, enter the *Model* name and the *API Key* (and a *Base URL* if you're using an in-house reader).

3 Test it

Click **Test Connection**. A green message confirms it's working; a red one explains what's wrong.

4 Save

Click **Save AI Settings**.

These settings affect everyone. If the AI reader isn't set up, documents that need it simply go to the Review Queue to be filled in by hand — nothing is lost.

Need help?

If something doesn't look right, don't worry — nothing you do here can lose a document. The safest steps are always: open the document, compare it with the scan on the left, correct the boxes, and click **Save Changes**.

If a document keeps showing an **AI error**, or a page won't load, contact your system administrator.
